RESEARCH PROJECT

03/2017~01/2018

Genome assembly

assembled the genome of *Jaltomata sinuosa* using PacBio and Illumina reads, annotated repeats and genes, conducted comparative analyses (gene family dynamics and gene molecular evolution) with other Solanaceae species [[Project Scripts](#)]

06/2015~02/2017

Phylogenomic study

assembled transcriptomes of 14 *Jaltomata* species (closely related plant taxon of tomato), generated phylogenetic relationship, inferred trait evolution, and identify candidate genes associated with morphological trait diversification [[Project Scripts](#)]

08/2014~05/2015

TE expression

quantified transcriptional activity of transposable elements in wild tomatoes using RNA-seq, and investigated their expression relationship with surrounding genes

06/2013~08/2014

Origin of red-fleshed papaya

sequenced the lycopene beta cyclase locus and its up/down-stream flanking regions in wild populations of red/yellow-fleshed papaya and cultivars, performed population genetic analyses to reveal the origin of allele in red-fleshed papaya

08/2012~08/2013

Sex chromosome evolution

performed comparative and population genetic analyses on the X/Y-linked genes on papaya sex chromosomes to suggest the degradation evolution of Y-linked genes

05/2010~06/2012

Wheat-rye allopolyploids

investigated genome compositions of synthetic wheat-rye allopolyploids using molecular (PCR and sequencing) and cytogenetic approach (FISH and GISH)
